"Effect of A. High-Temperature Heat Treatment Medium on the Structure and Magnetic Properties of Transformer Steel"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, Vol. 34, No. 2, Feb 70, pp 262-266

Abstract: The refining ability of various media in high-temperature annealing in industrial dome furnaces was studied by optical microscopy methods, by measuring magnetic properties and by determining the chemical composition of transformer steel. Four different steel compositions were tested in the experiment and their concentrations of Si, C, S, N, O, Al, Mn, and H before and after annealing in a vacuum or in a hydrogen or nitrogen medium are given in tabular form. It was found that high-temperature annealing in dome vacuum and gas furnaces did not ensure the required degree of refinement of the steel from C, N, O, and S impurities. Raising the degree of evacuation under high-temperature heat treatment of the steel in the most improved industrial furnaces also had little effect in improving the refinement. It was concluded that in order to

"Pulse Laser Using 62h Rhodamine Solution in Ethyl Alcohol with a
Radiation Energy of 110 Joules"

Leningrad, Zhurnal Tekhnicheskoy Fiziki, vol 42, No 7, 1972,
pp 1459-1461

Abstract: The laser described in this paper is pumped by a special lamp and uses a reflector space filled with MgO powder. Length of the ring-shaped discharge space is 45 cm, with a gap of 1 cm, and the space is filled with xenon at a pressure of 10 torr. A cross section of the laser as well as a cross section of the vessel serving as the inner wall of the laser are shown in diagram form. A filter of NaCOOCCH_3 was used to absorb ultraviolet light shorter than 230 nm and thus weaken the tendency to decay of the 62h rhodamine solution under light, with resultant increase in radiational energy. Curves are plotted for the current and voltage of the pumping pulse and the oscillation pulse as functions of time. The brightness temperature of the discharge was computed at about $20,000^\circ \text{K}$. The wavelength of the radiation generated was 590 nm and the width of the oscillation line 20 nm. The authors are associated with the Physics Institute of the Belorussian Academy of Sciences at Minsk.

"Study of the Parameters of a Hall Element with a Ferrite Concentrator"

Ashkhabad, Izvestiya Akademii Nauk Turkmeneskoy SSR, Seriya Fiziko-Tekhnicheskikh, Khimicheskikh i Geologicheskikh Nauk, No 5, 1971, pp 41-45

Abstract: Data are presented from a study of the parameters of a thin-crystalline Hall element between rectangular ferrite plates forming magnetic field concentrators. Graphs are presented of the voltage sensitivity of the Hall element with a concentrator as a function of the thickness of the concentrator plate, the voltage sensitivity of a Hall element with a concentrator and without it as a function of an intense magnetic field, and the voltage sensitivity of the Hall element with a concentrator and without it as a function of temperature.

The output of a Hall element can be increased by an order by means of small ferrite concentrators, and using a Hall element with a ferrite concentrator increases the effectiveness of the magnetic system of devices based on it. Hall elements with a concentrator must be used within the

limits of the magnetic field in which the amplification coefficient of the concentrator does not vary. The critical magnetic field is determined from the field dependence of the output voltage of the Hall element. The ferrite saturation begins with much smaller magnetic fields than those presented for a closed core.

"Investigation of a Two-Channel Reproducer Based on a Hall
Element"

Ashkhabad, Izvestiya Akademii Nauk Turkmensov SSR: Seriya
Fiziko-Tekhnicheskikh, Khimicheskikh i Geologicheskikh Nauk,
No 6, 1971, pp 23-29

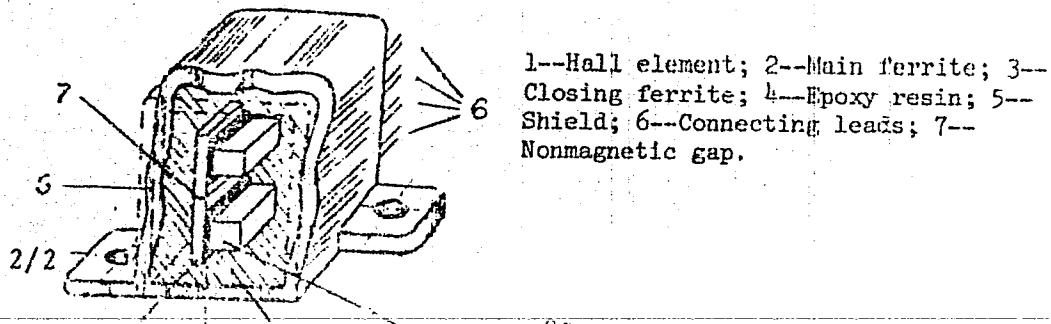

Abstract: The paper gives a description and the basic characteristics of a two-channel playback head based on an indium antimonide Hall element. The design of the device is shown in the accompanying figure. The base half of the magnetic circuit consists of two plates measuring 4 x 3 x 2 mm cemented together by EKS-1 adhesive so that the resultant plate measures 8 x 3 x 2 mm. The closing plates for each channel are separate with dimensions determined by the active section of the Hall elements -- 2.3 x 1.5 x 2 mm. After the Hall element is cemented to the ferrite base, it is ground off to a thickness

of a few microns. The thickness of the Hall element and the width of the working gap are checked by microscope. After potting with epoxy resin, the working surface of the head is machined. Tests show that the semiconductor head has satisfactory parameters and certain advantages over other types of reproducers. The parameters of the head can be improved by effective utilization of the magnetic system and the Hall element, and by improved manufacturing techniques. The resolution of the unit could be increased by finishing the working gap to a width of 2 microns or less. Four figures, three tables, bibliography of four titles.

SUKHANOV, S., PETINOV, V. P."Study of a Two-channel Hall Element Reproducing Head"Izvestiya Akademii Nauk Turkmenskoy SSR, Seriya Fiziko-tehnicheskikh, Khimicheskikh i Geologicheskikh Nauk, No 6, 1971, pp 23-29

Abstract: A study was made of a two-channel InSb Hall element reproducing head. The design of the head and the process of manufacturing it are discussed. A two-channel transistorized amplifier to amplify the output signal of the head to the required value is also described. The results of testing the head under operating conditions are presented in a table, and its operating characteristics are discussed. The method of joint manufacture of the Hall element and the magnetic circuit was used in building the two-channel magnetic head. The magnetic material used for the magnetic circuit was ferrite, and the semiconductor material for the Hall element plate was indium antimonide. The amplifier was executed according to a symmetric circuit and encompassed deep negative feedback. Stabilization of the amplifier parameters was achieved by including resistors in the emitter circuit which improved the frequency characteristic by decreasing the dynamic capacitance.

SUKHANOV, S., et al, Izvestiya Akademii Nauk Turkmenskoy SSR, Seriya Fiziko-tehnicheskikh, Khimicheskikh i Geologicheskikh Nauk, No 6, 1971, pp 23-29

Two identical amplifiers on separate boards combined into a common unit are required for the two-channelhead. InSb with $n = 7.8 \cdot 10^{16} \text{ cm}^{-3}$ was used in the Hall element to expand the temperature range. The Hall element operates stably up to 40 °C. The head has satisfactory parameters and some advantages over heads of other types. The resolution can be expanded by making the width of the operating gap 2 microns and less.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. DEMONSTRATION THAT THE SPATIAL FREQUENCY SPECTRUM OF A THREE DIMENSIONAL HOLOGRAM OF A PHASE OBJECT IS THE PRODUCT OF THE THREE DIMENSIONAL SPATIAL FREQUENCY SPECTRUM OF THIS OBJECT TIMES A TRANSFER FUNCTION WHICH DEPENDS ON THE PARAMETERS OF THE INCIDENT RADIATION. THIS FUNCTION, CALLED THE SPATIAL FREQUENCY INTERACTION CHARACTERISTIC, IN THE CASE WHERE THE OBJECT IS ILLUMINATED BY A PLANE MONOCHROMATIC WAVE, IS REPRESENTED IN THE FREQUENCY SPACE BY TWO OSCULATING SPHERES THE RADII OF WHICH ARE EQUAL TO THE VALUE OF THE WAVE VECTOR OF THE INCIDENT WAVE. IT IS NOTED THAT WITH A BROADENING OF THE INCIDENT RADIATION SPECTRUM THE SPATIAL FREQUENCY SPECTRUM OF THE THREE DIMENSIONAL HOLOGRAM TENDS TO THE SPATIAL FREQUENCY SPECTRUM OF THE OBJECT, AND THUS IN THE LIMITING CASE THE THREE DIMENSIONAL HOLOGRAM BECOMES A COPY OF THE OBJECT.

"Relation between Space-Frequency Spectra of a Three-Dimensional Phase Object
and Its Three-Dimensional Hologram"

Leningrad, Optika i Spektroskopiya; January, 1970; pp 126-31

Δ Δ Δ

ABSTRACT: It is shown that the space-frequency spectrum of a three-dimensional hologram of a phase object is the product of the three-dimensional space-frequency spectrum of the object and the transfer function varying with the parameters of the incident radiation. This function, called the space-frequency interaction characteristic for the case in which the object is illuminated by a flat monochromatic wave, is depicted in the space of frequencies of two spheres tangent to each other, whose radii are equal to the value of the wave vector of the incident wave. It is noted that with a broadening of the spectrum of the incident radiation the space-frequency spectrum of a three-dimensional hologram tends toward the space-frequency spectrum of the object and, thus, in the limiting case the three-dimensional hologram becomes a copy of the object.

A70-24308 # Control of the angular motion of a deformable satellite with distributed masses. I (Upredlenie uglovym dvizheniem deformiruemogo sputnika s raspredelennymi massami. I). V. Ju. Rutkovskii and V. M. Sukhanov. Kosmicheskie Issledovaniia, vol. 8, Jan. Feb. 1970, p. 71-75. IN Russian.

Development of a method of formulating the differential equations for the angular motion of deformable earth satellites, the distinguishing feature of which is the presence of elastic elements with a distributed mass. According to this method, the mechanical system in question is broken down into separate parts, one of which is a solid body (taken as the main body), while the remaining parts are elastic elements with a distributed mass. The equation of motion of the solid body under the action of the external forces and moments of the coupling reactions applied to the main body by

REEL/FRAME
19800067

12

AP0048360

arbitrarily repulsed elastic couplings is written. The problem of determining the forced vibrations of elastic elements with a distributed mass is formulated and solved. The solutions obtained are substituted into the known expressions for the forces and moments of the coupling reactions applied by the elastic elements to the main body, and the equation of motion of an elastic satellite is written in explicit form. By switching over from the integrodifferential equation thus obtained to an operator form, the transfer function of a deformable satellite as an automatic control plant is determined.

"Tungsten Wire as a Reinforcement for Heat-Resistant Composite Materials"

Moscow, Metallovedeniye i Termicheskaya Obrabotka Metallov, No 7, 1973, pp 45-46

Abstract: The strengths of VA, VT7, and VT15 alloys and of composite materials based on them were experimentally investigated. The results are presented in diagrams showing the temperature dependence of short-duration strength of tungsten wires and reinforced plates and the recrystallization of VT7 alloy wires. The wire of VA brand recrystallizes in the composite after 120-150 hr aging at 1100°C. In wires of VT7 alloy, a partial recrystallization takes place after 500-hr aging at 100°C. The 20-50 hr aging at 1200°C of the composite with tungsten reinforcement VA and VT7 results in complete collecting recrystallization in the wires. In wires of VA, VT7, and VT15 alloys, the process of collecting recrystallization begins at 1300°C after 6-7 hr aging. Two figures, two tables.

"Dilatometric Method of Evaluating Temperature Stresses in Nichrome-Tungsten Compositions"

Kiev, Problemy Prochnosti, No 9, Sep 72, pp 108-111

Abstract: A method is outlined for determining the internal heat stresses in compositions with a matrix of EI435 alloy and tungsten wire. The procedure is based on analysis of dilatometric curves of expansion. It is shown that the matrix is subjected to tensile stresses at low temperatures and compressive stresses at high temperatures. It is found how mechanical stresses influence the properties of the matrix as a whole. It is shown that the magnitude and sign of the internal stresses in the matrix must be taken into consideration when making parts from composition sheet material by bending or stamping.

Riga, Khimiya Geterotsiklicheskikh Soyedineniy, No 8, Aug 72, pp 1030-1032

Abstract: Oxindole and 1-methyloxindole condense with hydroxymethylene ketones in presence of HCl forming pyrylium/2,3-b/indoles. The reagents taken in methanol solution were saturated under cooling with dry HCl yielding: 1-oxonium-2,3-tetramethylenecarbazole chloride, m.p. 190-192°; 1-oxonium-2,3-tetramethylene-9-methylcarbazole chloride m.p. 141°; 3-methoxy-2,3-b-methyl-5,6-dihydro-13-oxoniumindole/3,2-b-phenanthrene chloride, m.p. 236°; and 2-(1-methyloxindolyl-3-methylene)indanone, m.p. 151°. Reacting 1-oxonium-2,3-tetramethylene-9-methylcarbazole chloride with phenylhydrazine gave 1-phenyl-3,4-tetramethylene-5-(1-methyloxindolyl-3)- Δ^2 -pyrazoline, m.p. 232°, while a reaction with hydroxylamine produced 3,4-tetramethylene-5-(1-methyloxindolyl-3)- Δ^2 -isoxazoline, m.p. 144°.

"Formation of Diindolylmethane Derivatives From Indole Derivatives
and Schiff Bases"

Riga, Khimiya Geterotsiklicheskih Soyedineniy, No 9, Sep 71,
pp 1209-1210

Abstract: Aromatic aldimines react with indole to give diindolylmethane derivatives. The reaction proceeds during prolonged boiling of components in toluene or at 20° in acetic acid. The formation of diindolylmethane derivatives by the reaction of Schiff bases with indole and its homologs does not depend on the reaction temperature, since the authors obtained the very same compounds at 20° (in acetic acid) and at -50° (in an ether-acetic acid solution).

"Isolation of A-Antigen of F. Tularensis"

Moscow, Zhurnal Mikrobiologii Epidemiologii i Immunobiologii, No 1, 1973,
pp 41-47

Abstract: An antigen, designated by the letter A, was isolated from a microbial mass of the virulent strain No 328 of *F. tularensis* holarctica killed with acetone. The extract was repeatedly purified by gel-filtration through Sephadex G-100 and chromatography on columns with DEAE-Sephadex borate. Analyses revealed that the A-antigen in the purified and homogeneous preparation was specific of virulent and vaccinal tularemia strains. It is a neutral polysaccharide or lipopolysaccharide free of proteins and nucleic acids, with a molecular weight somewhat smaller than 100,000. However, repeated intravenous injections of the purified preparation into rabbits failed to induce immunity. Thus, in the purified preparation, A-antigen is present as a haptene. Since live bacteria are immunogenic and dead bacteria are not, the haptenization is not caused by the process of isolation but is associated with death of the bacteria.

"Experience in Use of the Method of Variation Statistics to Determine the Extent of Infection of Farm Animals With Brucellosis"

Tr. In-ta Krayev. batol. KazSSR (Works of Institute of Regional Pathology of the Kazakh SSR), No 20, 1970, pp 169-171 (from RZh-58. Zhivotnovodstvo i Veterinariya, No 4, Apr 71, Abstract No 4.58.633)

Translation: For a comparative study of the distribution of brucellosis among different animal species, it is necessary to study the ratio of the infected cattle to infected sheep and goats. In the calculation of the degree of infection with brucellosis of livestock in a definite territory, it is expedient to use a threefold mean error index.

With Phase Type Automatic Frequency Control With a Mixer and a
Phase Detector in the Form of a Coincidence Stage"

Tr. Mosk. aviats. in-ta (Works of the Moscow Aviation Institute),
1969, Vol 188, pp 39-62 (from RZh-Radiotekhnika, No 4, 1970,
Abstract No 4D41)

Translation: The authors analyze and experimentally study a system with phase type automatic frequency control with a converter in the feedback loop and using a pulsed phase detector in the form of a coincidence stage. Oscillations in the controlled generator with the frequency f_r are compared in the converter with the fixed frequency f_0 of the reference oscillation. In steady-state operation, the oscillation frequency at the converter output is usually equal to the frequency F of the tunable generator oscillation: $f_r = f_0 \pm F$. Voltage from the phase detector output, after 1/2

Vol 188, pp 39-62

filtration by a low-frequency filter, tunes the controlled generator. Automatic frequency control makes it possible to obtain the combination f_0 and F at a low level of parasitic components in the output oscillation spectrum. If special measures are not taken, then it is possible that the controlled generator be tuned to a mirror frequency or to a $f_0 - F$ type frequency. Methods are proposed for avoiding mirror tuning and for combatting the effect of high-frequency components at the converter output. Original article: 6 bibliographic entries.

Kibernetika -- na Zluzhu Kommunizmu. T. 6 [Cybernetics in the Service of Communism, Vol 6 -- Collection of Works], Moscow, Energiya Press, 1971, pp 202-206, (Translated from Referativnyy Zhurnal, Kibernetika, No 10, 1971, Abstract No 10 V668 by A. Mikhaylova).

Translation: The win function of a game on a unit square is defined as follows: 1) two functions are fixed in area $0 \leq x \leq y \leq 1$, $0 \leq y \leq x \leq 1$; 2) is a continuous function with continuous partial derivatives in the area of the diagonal; 3) is concave-convex in the assigned area; 4) a function equal to the difference of values on the diagonal of the partial derivatives with respect to x of the functions fixing the wind function, changes its sign in the interval $(0, 1)$ a finite number of times. The spectra of the optimal strategies of both players are described. Several particular cases are studied.

"Investigation of Stresses Around Reinforced Holes by a Method of Optically Inactive Patches"
Moscow, Izvestiya Vysshikh Uchebnykh Zavedeniy, Mashinostroyeniye, No 3,
1970, pp 5-9

Abstract: Stresses in a plate, around symmetrically reinforced holes by means of optically inactive patches have been investigated. The plate specimen was made of an optically active OASO plastic, and the patches of an optically inactive SO-95 plastic. The reinforcing patches in the shape of rings (see Fig. 1), or rings with two milled segments (see Fig. 1c) were cemented to the plate. So prepared specimens were subjected to tensile stresses. On the basis of previous studies it was established that the optimum reinforcement is provided by a patch of an oval shape (see Fig. 1b). However, reinforcement of this shape is hard to machine. The experiments showed that a reinforcement patch shown on Fig. 1c is much simpler and still its characteristics are close to those of an oval patch. The study also showed that the coefficients of the concentration of stresses practically do not depend on 1/3

ABSTRACT/EXTRACT--(U) GP-0-. ABSTRACT. THE THIN FILM FIELD EFFECT TRANSISTORS (FET) DISCUSSED IN THIS PAPER WERE PREPARED BY THE METHOD OF VACUUM DEPOSITION. FOR INVESTIGATION OF THIN LAYERS OF ZINC TELLURIDE, THE FOLLOWING ELEMENTS WERE SIMULTANEOUSLY CONSTRUCTED ON ONE SUBSTRATE WITH TWO FET: 1) DIODE STRUCTURES OF METAL SEMICONDUCTOR METAL AND METAL-DIELECTRIC SEMICONDUCTOR METAL. 2) FIXED CAPACITANCE CAPACITORS. 3) PHOTOCONDUCTIVE CELL. 4) HALL PICKUP. 5) SEMICONDUCTOR LAYERS FOR DETERMINATION OF THE COEFFICIENT OF THE THERMOELECTROMOTIVE FORCE, AND FOR OPTICAL MEASUREMENTS. ON THE SPECIMENS PREPARED, MEASUREMENTS WERE CONDUCTED BY STANDARD METHODS OF THE STATIC CURRENT-VOLTAGE CHARACTERISTICS OF THE FET AND THE DIODE STRUCTURE. THE VOLTAGE CAPACITANCE CHARACTERISTICS WERE MEASURED BY THE BRIDGE METHOD. FROM INVESTIGATION OF THE HALL EFFECT, THE RESISTIVITY, AND THE THERMOELECTROMOTIVE FORCE OF THESE SAME SPECIMENS, THE CONCENTRATION AND MOBILITY OF THE BASIC CURRENT CARRIERS WERE DETERMINED. THE CONCENTRATION OF THE BASIC CURRENT CARRIERS WAS ON THE ORDER OF 10^{18} CM⁻³, THE RESISTIVITY OF THE FILM WAS (2-8) TIMES 10^{-4} CM⁻²V⁻¹ SEC, THE EFFECTIVE HALL MOBILITY WAS (5-8) CM²V⁻¹ SEC. THE COEFFICIENT OF THE THERMOELECTROMOTIVE FORCE AMOUNTED TO 100-200 MICROVOLT-DEGREE. THE AUTHORS BELIEVE THAT IT IS POSSIBLE ON THE BASIS OF P-ZINC TELLURIDE TO CREATE EFFECTIVE FIELD-EFFECT TRANSISTORS WITH INJECTING OF CONTACTS.

"Synthesis and Composition of Niobium Phosphate Ion Exchange Resins"

Moscow, Zhurnal Neorganicheskoy Khimii, Vol 16, No 4, Apr 71, pp 1026-1030

Abstract: The material was synthesized by a rapid mixing of an acid solution of sodium phosphate and basic solution of potassium niobate. The amount of concentrated HCl added to the solution of disubstituted sodium phosphate was governed by the optimal pH required at the equilibrium point. In the applicational synthesis the applicator was added in the amount needed to reach equilibrium in respect to the agent being applied. To prevent precipitation of Ce⁺⁺⁺, Fe⁺⁺⁺ and Cr⁺⁺⁺ phosphates, the coprecipitation was carried out in a medium in which these phosphates could not precipitate. To prevent coprecipitation of the applicator phosphate with niobium phosphate, the third component was added after precipitation of niobium phosphate. The gel obtained was left overnight for completion of the process. Then the material was decanted, filtered, dried and milled, the 0.1-0.2 mm fraction being collected. The applicator was then washed out with 0.5 N HCl until a negative test was obtained for the applicator ions.

"A Device for Generating Pseudorandom Signals"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tovarnyye Znaki,
No 6, Feb 72, Author's Certificate No 328442, Division G, filed 24 Jun 69,
published 2 Feb 72, p 151

Translation: This Author's Certificate introduces a device for generating pseudorandom signals. The device contains a binary counter based on flip-flops, mod-2 adders, DC amplifiers, kipp oscillators, and switches. As a distinguishing feature of the patent, in order to generate signals with a uniform, broad, discrete spectrum, one input of each mod-2 adder is connected to the output of the flip-flop for the least significant digit of the counter, the two other inputs are connected to the outputs of the flip-flops for the two most significant digits of the counter, and the outputs of the mod-2 adders are connected to the inputs of the corresponding switches. The other inputs of the switches are connected to the corresponding source of DC voltage, and the switch outputs are connected to

1/2

USSR

SITNIKOV, O. P., SUKHAREV, Yu. P., USSR Author's Certificate No 328442
the input of the first operational amplifier. Connected in the feedback circuit of the amplifier is a switch whose controlling input is connected to the output of the first kipp oscillator. The input of this kipp oscillator is connected to the input of the second kipp-oscillator and to the controlling input of another switch connected in the input circuit of a second operational amplifier. The other input of the second kipp oscillator is connected to a mod-2 adder, which is connected, in turn, to the outputs of the flip-flops of the two least significant digits of the binary counter.

Summary

The kinetics of the build up of internal stresses and the rate of formation of physical and chemical bonds during the production of polyurethane coatings have been correlated with the supermolecular structure nature and the cross-link density. The effect of the chemical bonds distribution inside supermolecular structures and between them on the physico-mechanical properties of coatings and the swelling kinetics has been studied.

"Dynamics of Clinical Manifestations of A2 Influenza in Children During Epidemic Periods of 1957 Through 1970"

Moscow, Sovetskaya Meditsina, No 5, 1972, pp 129-132

Abstract: Changes in A₂ influenza epidemics in children during 1957-1970 were examined. A total of 2200 case histories were investigated from epidemics in 1957, 1959, 1965, 1969 and 1970. Diagnosis was established by virus isolation in tissue culture, fluorescent antibody detection of virus antigen, and preparation of antibody titers. Symptoms remained generally unchanged throughout the period. However, the severity of attack was greater in 1957 and 1959, with higher fever, more pulmonary edemas, and further incidence of hemorrhagic syndrome. Symptoms of the encaphalitic and meningoencephalitic syndromes (brief cramps, loss of consciousness, delirium, dissociated meningeal indications) decreased in 1965 and went up in 1969 and 1970. A decrease of lethal cases and a lessening of the severity of pneumonia occurred overall. The significance of premorbid conditions and other virus complications in contributing to fatalities was observed. The lessened

1/2

USSR

SUKHAREVA, M. Ye., and MAKHLINOVSKAYA, N. L., Sovetskaya Meditsina, No 5, 1972, pp 129-132

severity of influenza is believed to be due to changes in the immunological structure of the population with prolonged circulation of virus A₂. Improved clinical facilities also are an important factor. However, influenza continues to have great significance in pediatric infectious pathology.

"Current Problems of Dysentery Among Children"

Moscow, Sovetskaya Meditsina, Vol 3,, No 7, Jul 70, pp 122-127

Abstract: An analysis was made of statistical data on dysentery among children in Moscow and other cities over several years. It was found that the most common dysentery is the less severe form caused by *Shigella sonnei*. Morbidity among infants has decreased in recent years, partly as a result of better diagnosis and partly due to improved sanitary conditions and better health among children. The frequency of latent dysentery has increased, however. Infected children should not be regarded as healthy carriers of bacteria, because they have definite pathological lesions in the rectum and sigmoid and their serological reactions are changed. A characteristic trait of the form of dysentery currently prevalent is slow elimination of the pathogens from the body and ensuing relapses. Simultaneous infection with acute viral respiratory disease severely aggravates this dysentery. Further research should be focused on developing reliable diagnostic tests for the acute, chronic, and hidden forms of dysentery. The cause of the long retention of pathogens should be determined. Care should be taken to avoid exposure of dysentery patients to viruses causing acute respiratory diseases.

"SAPPOR -- a System for Automating the Process of Making Optimum Decisions"

Moscow, Kibernetich. sistemy avtomatiz. proyektir.--sbornik (Cybernetic
Automated Design Systems--collection of works), 1973, pp 29-35 (from RZh-
Kibernetika, No 7, Jul 73, abstract No 7V633 by A. Doroshenko)

Translation: SAPPOR is a dialog system oriented for making optimum decisions in the process of designing technical devices. The system is realized on the BESM-3M computer with two memory arrays, the second being designed for operation of a screen panel. The software of the system is based on the modular principle and has the following modules:
1) "Model" -- for constructing the mathematical model of the object being designed. This block is replaceable and varies depending on the class of the object of optimization. In developing the SAPPOR, RLC circuits were taken as models. 2) "Formulation of the Problem" -- a compiler which prepares classes of problems formulated by the designer for

1/2

USSR

AL'PEROVICH, E. Ye. et al., Kibernetich. sistemy avtomatiz. proyektir.,
1973, pp 29-35

(5)

solution (calculating the characteristics of the object, optimizing the mathematical expectation in satisfying probability limitations, etc.).
3) "Method of Solution" -- a set of programs for finding the global minimum of an arbitrary curve, minimizing multiparameter functions and numerically solving problems in nonlinear programming. 4) "Check" -- enables following and controlling the process of finding the optimum with respect to information which may appear at the output (alphanumeric printer, screen panel) as ordered by the operator. 5) "Output of Results" -- gives the results of optimization in the form of graphs and tables on a screen panel or on paper with the use of an alphanumeric printer or a "Konsul" typewriter. The last four modules are universal and do not depend on the type of optimization object. An advantage of the SAPPOR is the possibility for operative search for the optimum decision and the combination of the designer's experience and intuition with rigorous mathematical methods. In this connection, the design process can be carried out without knowledge of computer programming and the corresponding methods of search optimization.

"Improving the Operational Reliability of Welded Joints and the Technological Properties of High-Strength EP184 Austenitic Steel"

Moscow, Teploenergetika, No 8, Aug 72, pp 46-49

Abstract: The article is a report on the results of joint research by various scientific research institutes and industrial organizations to determine what effect methods of melting EP184 steel might have on the work-

1/2

USSR

MOISEYEV, A. A. et al., Teploenergetika, No 8, Aug 72, pp 46-49

ing reliability of welded joints as well as on the other properties of the metal. It was found that crack formation in joints can be eliminated by reducing the oxygen content, as well as the concentrations of hydrogen, nitrogen, sulfur and phosphorus below certain levels. This can be done by melting from a fresh charge with subsequent vacuum-arc remelting. Electroslag remelting can be used as well, but is less effective.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. MANY INVESTIGATORS ARE OF THE OPINION THAT KINETOPLASTS ARE DERIVED FROM THE MITOCHONDRIAL CIRSTAE IN TRYPANOSOMIDS, AS BOTH CAN BE STAINED BY JANUS GREEN. STRIGOMONAS ONCOPELTI AND TRYPANOSOMA CRUZI WERE CULTURED IN VITRO AND COMPARATIVE CYTOCHEM. REACTIONS WERE PERFORMED TO INVESTIGATE THE NATURE OF THE KINETOPLASTS. INTRACELLULAR SUCCINIC DEHYDROGENASE (I) WAS LOCALIZED BY BLUE TETRAZOLIUM SALTS AND DNA (II) BY IMMOIFICATION OF FEULGEN'S FLUORESCENCE METHOD. I IS A SPECIFIC ENZYME OF MITOCHONDRIA, WAS ABSENT IN THE KINETOPLASTS OF 2 STRAINS OF TRYPANOSOMES, S. ONCOPELTI (LEPTOMONAD FORM) AND T. CRUZI (LEPTOMONAD AND CRETHIDIAL FORMS), WHEREAS, II WAS EASILY DEMONSTRATED IN THE PARASITE KINETOPLASTS. II WAS CONSPICIOUS BY ITS ABSENCE IN THE MITOCHONDRIA OF CELLS OF DIFFERENT ORIGINS, INCLUDING TRYPANOSOMES STUDIED. THESE OBSERVATIONS ARE CONTRADICTORY TO THE PRESENT BELIEF THAT THE KINETOPLASTS ARE AN ORGANOID OF MITOCHONDRIAL NATURE. METHODS OF FIXATION OF CELLS FOR CYTOCHEM. LOCALIZATION OF NUCLEIC ACIDS ARE DISCUSSED, AND DSO SUB4 FOLLOWED BY CHROMIC ANHYDRIDE GAVE THE BEST RESULTS. FACILITY: LAB. FUNC. CELL MORPHOL., INST. MOL. BIOL., MOSCOW, USSR.

Zeleneva, R. N.; Urinyyuk, V.M.

Moscow State University

The study of the effect of fractions isolated from the cells of Strigomonas oncopelti on sarcoma-180 revealed that the cellular homogenate stimulates the growth of this tumor, the amino-acid fraction inhibits it, the peptide fraction is inactive, the total lipid fraction inhibits the growth of sarcoma-180 at early periods of tumor development and causes stimulation in a more prolonged introduction; the lipid fraction devoid of sterines and their esters is not endowed with a stimulating action, both at early and late periods of tumor development, microsomal-mitochondrial fraction possesses a significant antitumorous activity; the removal of lipids by the extraction of this fraction with a chloroform-methanol mixture leads to a loss of its antitumorous effect.

(from RZH-Metallurgiya, No 11, Nov 70, Abstract No 11G165 DEP)

Translation: Results are presented of an investigation of some features of the process of coreduction of V ore and Karatau phosphorite. The process of formation of the metal phase and change in its composition is considered as far as the reduction of Fe, V, and P oxides is concerned. In the case of coreduction of V ore and phosphorite, the presence of V in the alloy is already observed at 1200°. Alleviated reduction of V in the given case is explained by the presence of large quantities of P, which possesses high bonding to V force, and also by faster and easier formation of the hydroxycarbide phase (due to the presence of ready C mixture and Fe, V, and P oxides in V ore) with the formation of which the reaction of V oxide reduction takes place. The rate constants are determined and the energy of activation of V reduction is calculated. (38 kcal/mole). 8 ill., 2 tables.

"Effect of Certain Factors on the Process of Pellet Production During Electrothermic Production of Phosphorus"

O vliyanii nekotorykh faktorov na protsess polucheniya okatyshey pri elektrotermicheskem proizvodstve fosfora (cf. English above), Institute of Metallurgy and Beneficiation of the Kazakh Academy of Sciences, Alma-Ata, 1970, 15 pp, ill., bibliogr., 1 nazv. (from RZH-Metallurgiya, No 11, Nov 70, Abstract No 11G166 DEP)

Translation: In connection with the development of a new flow chart for combined processing of V ore, which contains 70% SiO_2 and 0.85% V_2O_5 , with phosphite in the process of their electrothermic smelting, a question arises regarding the utilization of V ore and phosphorite fines, derived during the preparation of the charge for smelting. A possibility of obtaining pellets (O) from the mixture of V ore and phosphorite fines is considered and the effect of different factors on the O strength is studied. The positive effect of the grain size of the material, the quantity of the binder, and the temperature and the time of sintering on the O strength are shown and a mathematical dependence of the O strength on the above cited factors is obtained. The sintering temperature has the most significant effect on the O strength. 5 ill., 5 tables.

"Some Characteristics of Microplasma-Arc Welding of Sheet Materials"

Kiev, Avtomaticheskaya svarka, Sept 71, no 9, pp 40-42

Abstract: A paper on the possibility of controlling the volume of the weldpool using highly concentrated plasma heat sources is presented and the technology of microplasma pulsed-arc welding is detailed. The pulsed arc makes it possible to proportion the heat energy supply to the part being welded. The protective gas is selected so as to afford optimum ionization and maximum plasma jet reduction at the exit from the plasma forming duct and at the anode. Experiments conducted with a specially designed MPU-M microplasma unit on metal with $\delta > 0.3$ mm indicates the possibility of maintaining the welding current component constant. The use of modulated current in the arc enhances the latter's stability with

"Some Properties of Reinforced Cylindrical Shells"

Kiev, Poroshkovaya Metallurgiya, No 11(131), Nov 73, pp 31-35

Abstract: The described technological schema of the formation of cylindrical shells includes the explosive squeezing with subsequent heat treatment (heating up to 850° C and 50 min aging) of a composite consisting of a plastic matrix in the form of a foil on a nickel base and reinforcing tungsten fibers, 0.03 mm in diam., in the form of a grid. The results of an investigation of the high-temperature short-duration strength of the shells show that the short-duration strength of the composite at 800, 950, and 1100° C considerably exceeds the strength of the matrix. At 950° C the strengthening effect of the composite reaches 6, at 1100° C it reaches 12, with a simultaneous decrease in plasticity properties. After heat treatment the composites reveal thermal stresses which develop from the difference in the linear elongation and the elastic constants of the components of the composite.

"Decomposition of Some Phosphorus-Containing Peroxides in n-Nonane"

Leningrad, Zhurnal Obshchey Khimii, Vol 40, No 9, Sep 70,
pp 2019-2021

Abstract: Di-tert-butylperoxyethylphosphonate (I) and tert-butyl-peroxyethylethoxyphosphonate (II), n_{D}^{20} 1.4288, n_{D}^{20} 1.001, were synthesized by the reaction of the corresponding chlorides with tert-butylhydroperoxide in pyridine. Both are colorless liquids, the first being less stable at room temperature than the second. In n-nonane solution (I) decomposes quite rapidly at 90°, while (II) just begins to decompose at 130°, yielding a series of compounds. This thermal decomposition is well described by a kinetic equation of the zero order with regard to the peroxide. Changing the specific surface of the vessel has no effect on the rate of decomposition, which points out the homogeneity of the process. Increasing the

"The Effect of Manganese and Nickel on the Strength of Steel under Harsh Loading Conditions"

Moscow, Metallovedeniye, No 6, 1971, pp 41-43

Abstract: A study was made of the effect of manganese and nickel on steel strength under harsh loading conditions. Two groups of steels, the first containing melts with 0.5, 1.0, 2.0, and 4.0% Mn and 0.1, 0.2, and 0.4% C, the other with melts containing 0, 1.0, 2.0, and 4.0% Ni and 0.2, 0.3, and 0.5% C, 0.2-0.35% Si, 0.3-0.5% Mn, 0.017-0.027% P, and 0.023-0.03% S were investigated. Strength was found to depend on the annealing temperature and the content of C. The results are represented in curves showing the effects of Mn and Ni on plastic properties and of the annealing temperature on strength and the change of the cold brittleness threshold. The strength under harsh loading conditions for steels with 4% Mn and 0.4% C is considerably lower than for steels with smaller Mn content. A comparison of plasticity and cold brittleness changes of nickel-alloyed steels revealed the absence of a clear interdependence between macroplasticity and the tendency to brittle failure. Three figures, two bibliographic references.

"N,O-Diacylquinoneiminoximes"

Leningrad, Zhurnal Organicheskoy Khimii, Vol 6, No 9, Sep 70, pp 1834-1837

Abstract: Reaction of acyl chlorides with quinoneiminoximes in organic solvents, in presence of aqueous sodium bicarbonate solution yields the title compounds. For example: to a solution of 1.22 g of 1,4-benzoquinoneiminoxime in 50 cc acetone 2.35 ml of p-tolyl chloride was gradually added at 20-25° with stirring. The mixture was then cooled to 5-10°, 1.68 g of sodium bicarbonate in 20 cc water was added and stirred for 1 hr at 20-25° to yield N,O-di-p-tolyl-1,4-benzoquinoneiminoxime, m.p. 175°. Other compounds were synthesized in this manner in yields ranging from 73 to 93%. In aqueous and alcoholic base these compounds hydrolyze yielding quinoneoxime and quinonsimine-oxime salts, while in dilute inorganic acids their hydrolysis gives quinone-oxime esters.

"On the Combustion of Vegetable Materials Under Differing Compositions of the Surrounding Medium"

V sb. Gorenje i vzryv (Combustion and Explosion -- Collection of Works),
Moscow, "Nauka", 1972, pp 153-156 (from RZh-Mekhanika, No 3, Mar 73, Abstract
No 3B963)

Translation: The characteristics of the relationship of flame propagation from pine branches and the introduction of an air medium of helium, hydrogen oxide, nitrogen and oxygen, and also on the air pressure are investigated. The slight dependence of the combustion rate on pressure for a given composition, the presence of the linearity under a change of composition of the mixture and a given pressure, and also the results of thermocouple measurements testify to the validity of the hypothesis that inert gases upon diffusing inside the jet lower its temperature. Accordingly the rate of flame propagation decreases linearly and combustion ceases at a certain concentration of the additive. Authors' abstract.

"Program-controlled Machine for Gas-laser Cutting of Sheet Materials"

Moscow, Syarochnoye Proizvodstvo, No 4, Apr 72, pp 52-53.

Abstract: The Institute has developed a machine for cutting of alloy steels, titanium and other materials using carbon-dioxide lasers, allowing any contour to be cut in the tracking mode. Contour control of the machine is by a digital programmed device using punch tape. The machine has been tested using various materials including 1-10 mm sheets of low-carbon and alloy steels of various types. Good cutting accuracy has been achieved: parts have been cut from sheets up to 3 mm thick, with smooth, even edges, and very small zone of thermal effect near the cut. Cuts are very thin (a few tenths of a millimeter).

"Synthesis and Investigation of the Pharmacological Activity of 1-(Indolyl-3')-
2-alkylaminoethanols"

Moscow, Khimiko-farmatsevticheskiy zhurnal, Vol 4, No 10, Oct 70, pp 5-9

Abstract: 1-(Indolyl-3')-2-alkylaminoethanols were synthesized by hydrogenating the corresponding N- substituted 3-aminoacetylindoles, using Raney nickel as a catalyst. The resultant amino alcohols were converted to salts (chlorohydrates or adipinates) which were pharmacologically studied. The initial 3-alkylaminoacetylindoles were produced by interacting 3-chloroacetylindole or 3-bromoacetylindole with primary or secondary amines. The physicochemical properties of the 3-alkylaminoacetylindoles and 1-(indolyl-3')-2-alkylaminoethanols are tabulated. It was found that all amino alcohols containing the secondary amino group have sympathomimetic properties: they increase arterial blood pressure in rats and cats under anesthesia, cause contraction of the nictitating membrane, and constrict the peripheral vessels. This effect is

1/2

{ USSR

PREOBRAZHENSKAYA, M. N., et al, Khimiko-farmatsevticheskiy zhurnal, Vol 4,
No 10, Oct 70, pp 5-9

attributed to excitation of the α -adrenoreactive systems. The most active of all compounds studied was 1-(indolyl-3')-2-methylaminoethanol. This alcohol has only 1/10-1/20 the activity of adrenalin, but its effect is longer-acting. Amino alcohols containing the tertiary amino group did not cause contraction of the nictitating membrane, they reduced blood pressure and relaxed the peripheral vessels.

"Change in the Sorption Capacity of Ion Exchange Resin Towards Gossypol and Free Fatty Acids Under the Influence of γ -Irradiation"

Leningrad, Zhurnal Prikladnoy Khimii, Vol 45, No 8, Aug 72, pp 1828-1832

Abstract: Increase in the γ -irradiation dose leads to an increased swelling of the anion exchange resin AV-17-6(m) and EDE-10p in the OH⁻ form in distilled water and in methanol; the anion exchange resin EDE-10p in the CO₃²⁺ form and FAN-2 in the OH⁻ form increase their swelling also, but only to a certain specific dose. The weight of the anion exchange resin has been noted to increase also. Under the influence of γ -irradiation AV-17-6(m) anion exchange resin in the OH⁻ form exhibits selective sorption towards gossypol. Both the AV-17-6(m) and the EDE-10p anion exchange resins in the CO₃²⁺ form become lighter in color under the influence of increasing radiation dose.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE FOLLOWING SEQUENCE OF REACTIONS IS PROPOSED ON THE BASIS OF DTA, PETROGRAPHIC ANAL., X RAY STRUCTURAL ANAL., AND CONDUCTOMETRIC ANAL.: AT 515-200DEGREES CA(OH)₂ SUB2 EQUALS CAO.FE SUB2 O, AT 670-15DEGREES CAO PLUS FE SUB2 O SUB3 EQUALS CAO.FE SUB2 O SUB3, AND AT 750-800DEGREES CAO.FE SUB2 O SUB3 PLUS CAO.FE SUB2 O SUB3 INDEPENDENT OF THE WT. RATIO OF REACTING SUBSTANCES. OXIDE SEMICONDUCTORS BECOME REACTIVE WHEN THE CONCN. OF ELECTRONS IN THE FREE ZONE OF THE SEMICONDUCTOR SHARPLY INCREASES; THIS CORRESPONDS TO THE CHANGE FROM IMPURITY TO INTRINSIC COND. IN THE SEMICONDUCTOR OXIDE.

"Relaxation of Phase Boundaries in SbSI Single Crystals"

Moscow, Kristallografiya, Vol 18, No 2, Mar-Apr 73, pp 325-327.

Abstract: Changes in dielectric permeability with time ($\Delta\epsilon_{max} = f(t)$) are studied when a constant electric field acts on SbSI single crystals in the region of the phase transition. It is established that $\Delta\epsilon_{max}$ approaches saturation with increasing field intensity and decreases by several times as frequency is varied from 1 to 40 KHz. The decrease time of ϵ is reduced by 4 to 6 times when the specimen is illuminated and increases with increasing frequency. The dependences produced can be explained by the contribution to the value of ϵ of newly developing phase boundaries, the attachment time of which amounts to some tens of seconds.

"Investigation of the Process of Dielectric Hysteresis Loop (DHL) Formation in Single Crystals of SbSI"

V sb. Segnetoelektriки i okisnyye poluprovodniki (Ferroelectrics and Oxide Semiconductors -- Collection of Works), Dnepropetrovsk, 1971, pp 64-63 (from RZh-Fizika, No 1, Jan 72, Abstract No 1YM1306 by YE. A.)

Translation: The author studied the time dependence of DHL formation in single crystals of SbSI as a function of illumination, electric field strength, and temperature. Total electrical conductivity of the crystals was also measured as a function of the above-enumerated factors. The conclusion is drawn that the process of DHL formation in SbSI is due to the presence of space charges produced as a result of nonuniform impurity distribution over the crystal or on boundaries of ferroelectric domains.

"Low-Density Jets from a Sonic Nozzle at Large Pressure Drops"

Moscow, Zhurnal prikladnoy mekhaniki i tekhnicheskoy fiziki, No 2,
1973, pp 64-73

Abstract: Experiments are described for the observation of low-density gas dynamic jets using electron-beam analysis and the Pitot tube. A full description of the apparatus and the experimental method is given in earlier papers on which the present article is based (A. K. Rebrov, et al, Vliyanie razrezhennosti na strukturu svobodnoy strui azota -- Effect of Rarefaction on the Structure of a Free Nitrogen Jet -- PMTF, No 1, 1971, and others). These experiments used sonic nozzles consisting of openings in a thin wall with a ratio of wall thickness to opening diameter of less than 0.05. With a Reynolds number greater than 200 at the nozzle opening, the effect of the boundary layer in the nozzle can be neglected and the flow factor of the nozzle can be taken equal to unity. Nitrogen, air, and carbon dioxide at a drag temperature of 300° K were used as the operating gases. The purpose of the experiments was to study the structure of longitudinal and transverse gas
